

Action Plan - Medora (Smart Prescription Tracker) - Group 21

Introduction

Our project aims to develop a Smart Prescription Tracker system that enables patients and guardians to manage prescriptions efficiently while enabling pharmacists to verify and monitor prescriptions. The system enhances medication compliance and offers transparency in the prescription procedure through a centralized digital platform. Based on the feedback given during proposal defense, we revised the scope, removed unnecessary user roles and clarified key system functionalities and requirements.

Feedback and Actions

Feedback Received	Actions Taken
Including doctors in the system will make it more complicated and also it's unnecessary for this version.	We removed the doctor from the system roles. The new scope only consists of patient, guardian, pharmacist and admins, simplifying the architecture and development scope.
The system functionalities were too broadly defined.	We broke down the requirements into clearly defined, categorized functional and non-functional segments, based on the system user roles and their use cases.
Concern about the execution in real life and attaining the core goals within the scope and the timeline.	We pointed up key features like uploading prescriptions, authentication, tracking of compliance and removed advanced or out-of-scope features to keep the goals achievable.

Summary

System **Medora**, the Smart Prescription Tracker is currently a lean, functional project with attainable goals and a focused user base. In response to panel feedback, we trimmed features that were unnecessary and simplified requirements to be unambiguous and actionable. These changes enable better system design, also support the medication adherence and make the process of development simplified for the team.
